

BRG Control Computer

The EMN Control Computer is a command station that controls the master transmitters in your system. It provides the ability to activate a pre-recorded message, a Text-to-Speech (TTS) message, a live audio message or a message that is provided by an emergency texting RSS Feed. The control PC also allows you to dial into an analog phone line and activate a pre-recorded message or make a live audio message from any touch-tone or cellular telephone.

Any number of control points and master transmitters may be used within an EMN system. The master transmitter broadcasts audio and text to any number of electronic message boards and wireless paging speakers.

Few people want to speak live over a wide area paging system during stressful emergency conditions; and pre-recorded audio does not have the flexibility to follow changing conditions. However, BRG has developed a solution that uses the AT&T "Natural Voices" text-to-speech engine (TTS). The TTS system allows the accuracy of a typed message, and the flexibility of live audio, all with the clarity of professionally recorded audio. No other mass notification system offers this level of clear and concise communication.

Each Control PC Includes:

- Dell Vostro 220 or equivalent
- Intel Celeron 440 Processor or equivalent
- 4 GB Memory
- 32 GB solid state hard drive
- 17" flat panel monitor
- Dell Keyboard
- Internal speakers
- Microphone with desktop stand
- Windows XP Professional Operating System installed and configured to BRG specifications
- BRG EMN Software
- BRG Utility Software
- AT&T Natural Voices text-to-speech software™
- Telephone control interface
- Additional hardware pre-installed in system case
- Un-interruptable power supply (UPS)
- Toll free technical support
- 1-year warranty
