

Typical Coverage

Maximum Coverage

Many Colleges and Universities have the ability in place to text and e-mail students and faculty of emergencies. Most of these systems use a Web based RSS feed. Until recently, this system was limited to just e-mail, phones and pagers.

Now the same emergency messages that are activated through emergency dialing software can also be delivered to the entire facility utilizing the BRG Wireless Emergency Mass Notification (EMN) System. Using the latest text-to-speech technology from AT&T the BRG system will send out alpha-numeric messages to all BRG Wireless Audio/Message Displays, BRG Wireless speakers and BRG Outdoor Broadcast Systems. Our system can even integrate into most fire panel systems to utilize fire alarm speakers to warn students and faculty of an emergency.

How does it work? BRG's EMN Software ties into the URL that broadcasts the RSS feed supplied by the paging software. When an alert is sent from the paging software, the BRG EMN Software automatically sends out a audio alert to all BRG speakers and a text alert to all BRG message displays.

When an "all clear" is sent from the paging software, the BRG EMN Software automatically changes the BRG message displays back to time.
